### TÓM TẮT

Chi *Pilea* là chi lớn nhất của họ Urticaceae, bao gồm hơn 600 loài. *Pilea* được mô tả lần đầu tiên bởi nhóm tác giả Lindley năm 1821 và Weddell năm 1869 và có thể dễ dàng phân biệt với các chi khác trong họ Urticaceae bằng sự kết hợp của các lá mọc đối, các lá kèm trong cuống lá có dây chằng ở mỗi nách lá. Dựa vào hình thái rìa lá, 159 loài của chi *Pilea* đã được định danh và phân thành 3 nhóm: Integrifoliae, Heterophyllae và Dentatae. Killip vào năm 1936 chia *Pilea* thành 12 nhóm chủ yếu dựa trên nghiên cứu của Weddell vào năm 1856, 1869. Hầu hết các loài là các loại thảo mộc nhỏ, nhiều trong số đó là thực vật biểu sinh. Từ cao chloroform và cao acetone của cây Lẩn tẩn (*Pilea microphylla*) đã phân lập được bảy hợp chất tinh khiết, bao gồm ergosterol (**1**),  $\beta$ -sitosterol (**2**), daucosterol (**3**), isoarborinyl acetate (**4**), 2',4'-dihydroxy-6'-methoxy-3',5'-dimethylchalcone (**5**), 3,5,7-trihydroxy-8-methoxyflavone (**6**) và kaempferol (**7**). Cấu trúc hóa học của các hợp chất được xác định dựa trên các phương pháp hóa lý hiện đại như phổ HR-ESI-MS, 1D và 2D-NMR và so sánh với tài liệu tham khảo. Tất cả bảy hợp chất này lần đầu tiên được cô lập từ chi *Pilea*.

**Từ khóa:** *Pilea microphylla* (L.), urticaceae, steroid, triterpenoid, flavonoid.

## ABSTRACT

*Pilea*, the largest genus of the Urticaceae, included over 600 species. This genus, first described by Lindley in 1821 and Weddell in 1869, is easily distinguished from other Neotropical Urticaceae by the combination of opposite leaves and ligulate intrapetiolar stipules in each leaf axil. Based on the isomorphy and margin morphology of the leaf 159 species were recognized and classified into three groups: Integrifoliae, Heterophyllae, and Dentatae. Killip in 1936 subdivided *Pilea* into 12 groups largely based on Weddell's studies in 1856, 1869. Most of the species are small herbs, many of which are facultatively epiphytic or epipetric. Phytochemical investigations of the chloroform and acetone extracts of the whole plant *Pilea microphylla* led to the isolation of seven pure compounds, including ergosterol (1),  $\beta$ -sitosterol (2), daucosterol (3), isoarborinyl acetate (4), 2',4'-dihydroxy-6'-methoxy-3',5'-dimethylchalcone (5), 3,5,7-trihydroxy-8-methoxyflavone (6), and kaempferol (7). Their chemical structures were elucidated by extensive HR-ESI-MS, 1D and 2D-NMR spectroscopic data analysis, and comparison with previously published ones. Seven compounds were reported for the first time from *Pilea* genus.

**Keywords :** *Pilea microphylla* (L.), urticaceae, steroids, triterpenoid, flavonoid.

## 1. INTRODUCTION

*Pilea microphylla*, a succulent herb or small shrub growing in heavy shade, does not produce fruit. This species can spread entirely depending on vegetative reproduction. According to Pacific Island Ecosystems at Risk in 2010, *P. microphylla* is considered as a problematic weed affecting the tropical and subtropical environments worldwide.<sup>1,2</sup> Zou *et al*<sup>3</sup> reported the presence of some flavonoid glycosides in *P. microphylla*, quercetin 3-*O*-rutinoside,

3-*O*-caffeoylquinic acid, luteolin 7-*O*-glucoside, apigenin 7-*O*-rutinoside, apigenin 7-*O*- $\beta$ -D-glucopyranoside and quercetin.<sup>3</sup> Chahardehi *et al*<sup>4</sup> showed that some extracts of this plant possessed antioxidant and antimicrobial activities. This paper would like to present some secondary metabolites of this species.

## 2. MATERIALS AND METHODS

### 2.1. General experimental procedures

The HR-ESI-MS was recorded on an HR-ESI-MS MicrOTOF-Q mass spectrometer. The

$^1\text{H}$ -NMR (500 MHz) and  $^{13}\text{C}$ -NMR (125 MHz) spectra were recorded on a Bruker Avance 500 spectrometer. Chemical shifts are expressed in ppm using a residual solvent signal as an internal reference ( $\text{CDCl}_3$ ,  $\delta_{\text{H}}$  7.26,  $\delta_{\text{C}}$  77.2). Thin-layer chromatography (TLC) was carried out on precoated silica gel 60 F<sub>254</sub> or silica gel 60 RP-18 F254S (Merck) and the isolated compounds were visualized by spraying with vanillin (contains  $\text{H}_2\text{SO}_4$ ) ethanol solution (for TLC stain) followed by heating. Gravity column chromatography was performed on silica gel 60 (0.040 mm ÷ 0.063 mm, Himedia).

## 2.2. Plant material

*Pilea microphylla* (L.) was collected in August 2018, at Bien Hoa city, Dong Nai province, Vietnam. The scientific name was authenticated by PhD. Dang Van Son, Institute of Tropical Biology, Southern Vietnam.

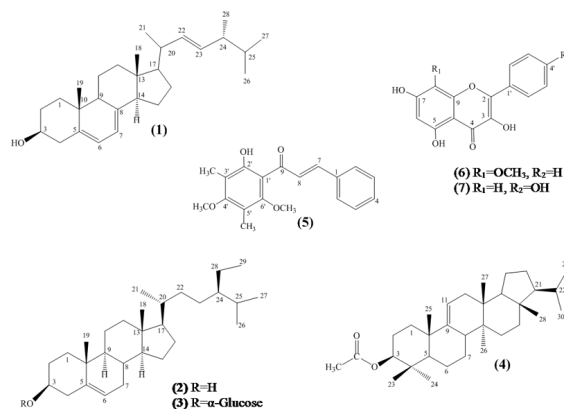

## 2.3. Extraction and isolation

The fresh whole plant (47.0 kg) was cleaned under running tap water, then air-dried and ground. The dried powder (3.1 kg) was macerated with methanol at room temperature. After filtration, the methanol solution was exhaustively evaporated at the reduced pressure yielding a dark-green residue (483.7 g). The methanol residue was subjected to silica gel solid phase extraction and eluted consecutively with *n*-hexane, chloroform, acetone, ethyl acetate. After evaporated at the reduced pressure of these extracted solutions, five extracts were obtained, including *n*-hexane (25.5 g), chloroform (40.7 g), ethyl acetate (36.9 g), acetone (71.9 g), and the remaining methanol residue (189.1 g).

The chloroform extract (40.7 g) was applied to silica gel column chromatography eluted with *n*-hexane: chloroform (stepwise, 9:1 to 0:10) to afford thirteen fractions (C1 ÷ C13). The fraction C5 (126.3 mg) was selected for further fractionation by silica gel column chromatography, eluting with *n*-hexane: chloroform (stepwise, 10:0 to 0:10) to obtain compound 4 (20 mg). Fraction C11 (4,850.4 mg)

was applied on silica gel column chromatography eluting with *n*-hexane: ethyl acetate (stepwise, 9.8:0.2 to 5:5) to obtain compound 2 (15 mg). Fraction C12 (3,664.5 mg) was selected for further fractionation by silica gel column chromatography using an isocratic mobile phase consisting of *n*-hexane: ethyl acetate (10:0 to 0:10) to obtain compound 1 (7.5 mg).

The acetone extract (7.5 g) was applied to silica gel column chromatography, eluted with solvent systems of *n*-hexane: ethyl acetate (10:0 to 0:10), then ethyl acetate: methanol (7:3 to 0:10) to afford eight fractions (A1 ÷ A8). The fraction A2 (168.2 mg) was applied on silica gel column chromatography using *n*-hexane: ethyl acetate (8:2), then *n*-hexane: chloroform (8:2) and finally by *n*-hexane: acetone (9:1) to obtain compound 5 (5.0 mg). The fraction A5 (1150 mg) was applied on silica gel column chromatography using *n*-hexane: ethyl acetate (6:4 to 0:10) then methanol 100% to obtain four subfractions (A5.1 ÷ A5.4). The A5.1 (39.1 mg) was applied to a silica gel column chromatography using *n*-hexane: chloroform (5:5 to 0:10), then *n*-hexane: acetone (9:1) to obtain compound 6 (5.3 mg). The same procedure was applied to A5.2 (222.6 mg), using *n*-hexane: chloroform (5:5 to 0:10), then chloroform: methanol (9:1) to obtain compound 7 (9.3 mg). Fraction A7 (408.5 mg) was applied on silica gel column chromatography using chloroform: methanol (stepwise, 9:1 to 0:10) to obtain compound 3 (15 mg).

**Figure 1.** Structures of isolated compounds 1 ÷ 7.

### 3. RESULTS

By using efficient separation techniques, the chemical investigation of the chloroform and acetone extracts of the whole plant of *Pilea microphylla* led to the isolation of seven compounds. Their chemical structures were elucidated by 1D and 2D NMR and HR-ESI-MS analysis. They were three steroids, ergosterol (**1**),  $\beta$ -sitosterol (**2**), and daucosterol (**3**), one triterpenoid, isoarborinyl acetate (**4**) and three flavonoids, 2',4'-dihydroxy-6'-methoxy-3',5'-dimethylchalcone (**5**), 3,5,7-trihydroxy-8-methoxyflavone (**6**), and kaempferol (**7**).

**Ergosterol (1):** Colorless crystals. HR-ESI-MS (positive mode)  $m/z$  397.3483  $[M+H]^+$  (calcd. for  $C_{28}H_{44}O+H$ , 397.3473). The  $^1H$  and  $^{13}C$ -NMR ( $CDCl_3$ ) see Table 1.

**$\beta$ -Sitosterol (2):** White powder.  $^1H$ -NMR data ( $CDCl_3$ ) ( $J$  in Hertz):  $\delta_H$  3.55 (1H, *ddd*, 15.8, 11.0, 4.6, H-3), 5.38 (*d*, 5.2, H-6), 1.03 (3H, *s*, H-18), 0.70 (3H, *s*, H-19), 0.95 (3H, *d*, 6.6, H-21), 0.88 (3H, *d*, 7.5, H-26), 0.84 (3H, *d*, 6.5, H-27), 0.85 (3H, *t*, 7.0, H-29). The  $^{13}C$ -NMR ( $CDCl_3$ ):  $\delta_C$  37.3 (C-1), 31.7 (C-2), 71.8 (C-3), 42.3 (C-4, C-13), 140.8 (C-5), 121.7 (C-6), 31.9 (C-7, C-8), 50.2 (C-9), 36.1 (C-10, C-20), 21.1 (C-11), 39.8 (C-12), 56.8 (C-14), 26.2 (C-15), 28.2 (C-16), 56.1 (C-17), 11.9 (C-18), 18.8 (C-19, C-21), 34.0 (C-22), 24.3 (C-23), 45.9 (C-24), 29.2 (C-25), 19.4 (C-26), 19.8 (C-27), 23.1 (C-28), 12.0 (C-29).

**Daucosterol (3):** White crystal, HR-ESI-MS (positive mode)  $m/z$  577.4498  $[M+H]^+$  (calcd. for  $C_{35}H_{60}O_6 + H$ , 577.4428).  $^1H$ -NMR data ( $CDCl_3$ ) ( $J$  in Hertz):  $\delta_H$  4.24 (*m*, H-3), 5.33 (*m*, H-6), 0.63 (3H, *s*, H-18), 0.91 (3H, *s*, H-19), 0.96 (3H, *d*, 6.4, H-21), 0.83 (3H, *d*, 6.8, H-26), 0.87 (3H, *d*, 7.4, H-27), 0.85 (3H, *m*, H-29), 5.01 (1H, *d*, 7.7, H-1'), 4.02 (1H, *t*, 8.1, H-2'), 3.89-3.96 (1H, *m*, H3', 4'), 4.24 (1H, *m*, H-5'), 4.37 (1H, *dd*, 11.7, 5.3, H-6'a), 4.52 (1H, *dd*, 11.8, 2.5, H-6'b). The  $^{13}C$ -NMR ( $CDCl_3$ ):  $\delta_C$  37.5 (C-1), 30.8 (C-2), 79.1 (C-3), 39.9 (C-4), 141.5 (C-5), 122.4 (C-6), 32.6 (C-7), 32.7 (C-8),

51.0 (C-9), 38.0 (C-10), 21.8 (C-11), 40.5 (C-12), 43.0 (C-13), 57.4 (C-14), 25.0 (C-15), 29.1 (C-16), 56.8 (C-17), 12.5 (C-18), 20.0 (C-19), 36.9 (C-20), 19.6 (C-21), 34.8 (C-22), 27.0 (C-23), 46.6 (C-24), 30.0 (C-25), 19.8 (C-26), 20.5 (C-27), 24.0 (C-28), 12.7 (C-29), 103.1 (C-1'), 75.9 (C-2'), 79.0 (C-3'), 72.3 (C-4'), 78.7 (C-5'), 63.4 (C-6').

**Isoarborinyl acetate (4):** Colorless crystal, HR-ESI-MS (positive mode)  $m/z$  469.4044  $[M+H]^+$  (calcd. for  $C_{32}H_{53}O_2+H$ , 469.4048). The  $^1H$  and  $^{13}C$ -NMR ( $CDCl_3$ ) see Table 1.

**2',4'-Dihydroxy-6'-methoxy-3',5'-dimethylchalcone (5):** Pale yellow crystal, HR-ESI-MS (positive mode)  $m/z$  299.1291  $[M+H]^+$  (calcd. for  $C_{18}H_{18}O_4+H$ , 299.1283). The  $^1H$  and  $^{13}C$ -NMR ( $CDCl_3$ ) see Table 2.

**3,5,7-Trihydroxy-8-methoxyflavone (6):** White powder, HR-ESI-MS (positive mode)  $m/z$  301.0706  $[M+H]^+$  (calcd. for  $C_{16}H_{12}O_6+H$ , 301.0712). The  $^1H$  and  $^{13}C$ -NMR ( $CDCl_3$ ) see Table 2.

**Kaempferol (7):** Yellow amorphous powder, HR-ESI-MS (positive mode)  $m/z$  287.0515  $[M+H]^+$  (calcd. for  $C_{15}H_{10}O_6+H$ , 287.0555). The  $^1H$  and  $^{13}C$ -NMR ( $CDCl_3$ ) see Table 2.

### 4. DISCUSSION

The chemical structures of seven isolated compounds were elucidated based on the analysis of HR-MS, 1D and 2D NMR spectroscopic spectra as well as the comparison of their data with those in the literature. The common compounds in plants such as  $\beta$ -sitosterol<sup>5</sup> and daucosterol,<sup>6,7</sup> after comparison of the data with the ones in the literature, their NMR ones were presented in the Part 2- Material and Methods, without discussion on their chemical elucidation.

Compound **1** was isolated as colorless crystals. Its molecular formula was determined as  $C_{28}H_{44}O$  through its molecular ion peak at  $m/z$  397.3483  $[M+H]^+$  (calcd. for  $C_{28}H_{44}O+H$ , 397.3473). The  $^1H$ -NMR data exhibited signals

for six methyl groups  $\delta_H$  0.63 (*s*, H-19), 0.83 (*d*,  $J = 7.6$  Hz, H-26), 0.83 (*d*,  $J = 6.8$  Hz, H-27), 0.92 (*d*,  $J = 6.9$  Hz, H-28), 0.95 (*s*, H-18), and 1.04 (*d*,  $J = 6.7$  Hz, H-21), signals  $\delta_H$  5.57 (*dd*,  $J = 5.8, 2.6$  Hz) and 5.38 (*dd*,  $J = 5.6, 2.8$  Hz) diagnostic for olefin hydrogens H-6 and H-7, besides multiplet in  $\delta_H$  3.63 (H-3) indicate the presence of hydrogen linked to carbinolic carbon. Double bonds were observed at signal  $\delta_H$  5.19 (*m*) and 5.21 (*m*) relative to H-22 and H-23. The  $^{13}\text{C}$ -NMR spectra revealed C28-sterol ergostane skeleton, including signals of six methyl carbons, seven methylene carbons, eleven methine carbons (four olefinic carbons, one oxygenated methine carbon), and four quaternary carbons (two olefinic carbons) (Table I). The good compatibility of its NMR and HR-ESI-MS data with those in the literature proposed that compound **1** was ergosterol.<sup>8</sup>

The molecular formula of compound **2** was determined as  $\text{C}_{29}\text{H}_{50}\text{O}$ . The  $^1\text{H}$ -NMR spectrum of **2** showed the presence of two methyl singlet protons at  $\delta_H$  1.03 (*s*, H-18), and 0.70 (*s*, H-19), three methyl doublet protons at  $\delta_H$  0.95 (*d*,  $J = 6.5$  Hz, H-21), 0.88 (*d*,  $J = 7.5$  Hz, H-26), and 0.84 (*d*,  $J = 6.5$ , H-27) and methyl triplet protons at  $\delta_H$  0.85 (3H, *t*, 7.0, H-29) together with one olefinic proton at  $\delta_H$  5.38 (*d*,  $J = 5.2$  Hz, H-6) which suggested the sterol structure. In addition, the spectrum of compound **2** showed the presence of twenty nine carbons, including six methyl carbons  $\delta_C$  11.9 (C-18),  $\delta_C$  12.0 (*s*, C-29),  $\delta_C$  18.8 (C-19),  $\delta_C$  19.0 (C-21),  $\delta_C$  19.4 (C-26), and  $\delta_C$  19.8 (C-27), eleven methylene carbons  $\delta_C$  21.1–42.3, nine methine carbons  $\delta_C$  29.2–71.8 [one oxygenated methine carbon  $\delta_C$  71.8 (C-3), one olefinic carbon  $\delta_C$  121.7 (C-6)], and three methine carbon  $\delta_C$  36.1 (C-10),  $\delta_C$  42.3 (C-13),  $\delta_C$  140.8 (C-5). Based on the above evidence and the comparison of NMR spectral data with those reported for phytosterols, compound **2** was a plant sterol,  $\beta$ -sitosterol.<sup>9</sup>

Compound **3** was isolated as a white crystal. It was quickly identified as daucosterol

because it possessed similar NMR data to compound **2**. The similarity in the NMR data just with the replacement of hydroxyl proton of carbon C-3 ( $\delta_H$  4.24). It was replaced by glucopyranose ( $\delta_H$  3.89–5.01). Its molecular formula  $\text{C}_{35}\text{H}_{60}\text{O}_6$  was determined through the pseudomolecular ion peak at  $m/z$  577.4498  $[\text{M}+\text{H}]^+$  (calcd. for  $\text{C}_{35}\text{H}_{60}\text{O}_6+\text{H}$ , 577.4428). Consequently, the structure of compound **3** was daucosterol.<sup>10,11</sup>

Compound **4** was obtained as colorless powder. Mass spectra exhibited a pseudomolecular ion peak at  $m/z$  469.4044 (calcd for  $\text{C}_{32}\text{H}_{53}\text{O}_2^+$ , 469.4067), which corresponded with  $\text{C}_{32}\text{H}_{52}\text{O}_2$ . The  $^1\text{H}$ - and  $^{13}\text{C}$ -NMR data of **4** disclosed 32 carbon signals including one acetyl ester group ( $\delta_H$  2.04, 3H, *s*;  $\delta_C$  21.3, 171.0, 3–COCH<sub>3</sub>), one oxymethine ( $\delta_H$  4.47, *dd*, 11.7, 4.1 Hz;  $\delta_C$  80.9, C-3); one olefinic methine ( $\delta_H$  5.22, *d*, 6.2 Hz;  $\delta_C$  114.6, C-11); one olefinic quaternary carbon ( $\delta_C$  148.5, C-9); six quaternary methyls  $\{(\delta_H$  0.85, 3H, *s*;  $\delta_C$  28.2, C-23); (0.87, 3H, *s*; 16.8, C-24); (1.04, 3H, *s*; 22.2, C-25); (0.79, 3H, *s*; 17.0, C-26); (0.75, 3H, *s*; 15.3, C-27); (0.74, 3H, *s*; 14.0, C-28)}; two tertiary methyls  $\{(\delta_H$  0.88, 3H, *d*, 6.5 Hz;  $\delta_C$  22.1, C-29) and (0.82, 3H, *d*, 6.5 Hz;  $\delta_C$  23.0, C-30)} and 9 methylenes, 5 methines and 5 quaternary carbons in the high field zone. The presence of 32 signals on  $^{13}\text{C}$ -NMR and the correlations observed on 1D and 2D spectra led to identification of compound **4** as isoarborinyl acetate, a hopane triterpene.<sup>5</sup>

Compound **5** was isolated as a pale yellow powder. The combination of analysis of  $^1\text{H}$ - and  $^{13}\text{C}$ -NMR data revealed that **5** contained a mono-substituted benzene ring  $\{(\delta_H$  7.65, 2H, *dd*, 7.6, 2.0 Hz, H-2, H-6), (7.41, 3H, *m*, H-3, H-4, H-5);  $\delta_C$  135.6 (C1), 128.6 (C-2), 129.1 (C-3), 130.3 (C-4), 129.1 (C-5), 128.6 (C-6)}; a hexa-substituted benzene one  $\{\delta_C$  109.3 (C1'), 162.2 (C-2'), 106.7 (C-3'), 159.3 (C-4'), 109.0 (C-5'), 159.1 (C-6')\}; one conjugated ketone carbon ( $\delta_C$  193.5), two *E*-configuration olefinic carbons  $\{(\delta_H$  7.84, 1H, *d*, 15.7 Hz,  $\delta_C$  143.0,

C-7) and (7.98, 1H, *d*, 15.7 Hz,  $\delta_C$  127.0, C-8)}; one methoxy group ( $\delta_H$  3.66, 3H, *s*;  $\delta_C$  62.5, 6'-OCH<sub>3</sub>) and two methyl groups {( $\delta_H$  2.13, 3H, *s*;  $\delta_C$  7.7, 3'-CH<sub>3</sub>) and (2.16, 3H, *s*;  $\delta_C$  8.4, 5'-CH<sub>3</sub>). The positions of these substituents were supported by keys of HMBC correlation (Figure 2). The molecular formula of **5** was determined as C<sub>18</sub>H<sub>18</sub>O<sub>4</sub> proved by the pseudomolecular ion peak at *m/z* 299.1291 [M+H]<sup>+</sup> (calcd. for C<sub>18</sub>H<sub>18</sub>O<sub>4</sub>+H, 299.1283) in the HR-ESI-MS spectrum. Therefore, **5** was 2',4'-dihydroxy-6'-methoxy-3',5'-dimethylchalcone.<sup>6,7</sup>

Compound **6** was isolated as white powder. Its molecular formula was determined as C<sub>16</sub>H<sub>12</sub>O<sub>6</sub> through its pseudomolecular ion peak at *m/z* 301.0706 [M+H]<sup>+</sup> (calcd. for C<sub>16</sub>H<sub>12</sub>O<sub>6</sub>+H, 301.0712) in the HR-ESI-MS spectrum. The combination of analysis of HR-MS, <sup>1</sup>H- and <sup>13</sup>C-NMR data revealed that **6** was a flavonoid with a mono-substituted B ring {( $\delta_H$  8.23, 2H, *m*, H-2', H-6'), 7.50–7.55 (3H, *m*, H-3', H-4', H-5');  $\delta_C$  130.9 (C-1'), 127.7 (C-2'), 128.9 (C-3'), 130.5 (C-4'), 128.9 (C-5'), 127.7 (C-6')}; a penta-substituted A ring {( $\delta_H$  6.46, *s*, H-6);  $\delta_C$  155.6 (C-5), 98.4 (C-6), 156.8 (C-7), 127.1 (C-8), 148.2 (C-9), 103.8 (C-10)}; three carbons of the C ring { $\delta_C$  145.1 (C-2), 136.7 (C-3), 175.8 (C-4)}, and a methoxy group ( $\delta_H$  4.05, 3H, *s*;  $\delta_C$  62.1, 8-OCH<sub>3</sub>). The positions of these substituents were supported by keys of HMBC correlation (Figure 2). The comparison of these data with those of 3,5,7-trihydroxy-8-methoxyflavone showed the similarity.<sup>9</sup> Therefore, the chemical structure of **6** was elucidated as shown.<sup>12</sup>

Compound **7** was obtained as a yellow amorphous powder. Its molecular formula was determined as C<sub>15</sub>H<sub>10</sub>O<sub>6</sub> through its pseudomolecular ion peak at *m/z* 287.0515 [M+H]<sup>+</sup> (calcd. for C<sub>15</sub>H<sub>10</sub>O<sub>6</sub>+H, 287.0555). The combined analysis of HR-MS, 1D and 2D-NMR data (Tables 2 and Figure 2) as well as the comparison of its data with the ones in the literature<sup>10</sup> showed that compound **7** was kaempferol.<sup>13</sup>

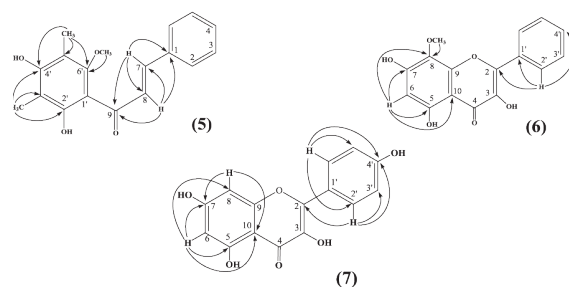

Figure 2. Keys HMBC correlation of **5** ÷ **7**.

## 5. CONCLUSION

From the chloroform and acetone extracts of the *Pilea microphylla* (L.), collected at Bien Hoa city, Dong Nai province, Vietnam, using various chromatographic methods, seven compounds were isolated. They were ergosterol (**1**),  $\beta$ -sitosterol (**2**), daucosterol (**3**), isoarborinyl acetate (**4**), 2',4'-dihydroxy-6'-methoxy-3',5'-dimethylchalcone (**5**), 3,5,7-trihydroxy-8-methoxyflavone (**6**) and kaempferol (**7**). Although these compounds were already known in other species, this is the first time they were reported in *Pilea microphylla*.
